Saikeertana Gubbala

Section 003

Research Question

"What is the prevalence of disparities in health outcomes such as disease prevention, or mortality rates among different demographic groups (age, gender, race/ethnicity) or geographic location, in relation to the disease of Alzheimer's?"

Resources

- I will construct either a logistic regression model or a linear regression model in Python based on the data from data.cdc.gov
- After I have built my model, I can explore the relationship between demographic factors and outcomes such as the mortality rates due to Alzheimer's disease and interpret key insights provided from the model.
- The specific dataset I will use is included in my submission named "Alzheimers_Disease.csv"
